Question	Should I recommend that patients use electronic cigarettes ("e-cigarettes") as a tool to complete smoking cessation?
Answer	No, we do not recommend the use of e-cigarettes as a tool to complete smoking cessation.

Background

- Article Title: "Electronic Nicotine-Delivery Systems for Smoking Cessation"
- · Journal: The New England Journal of Medicine
- Publication Date: February 15, 2024
- Abstract Summary: With funding from the Swiss government, an open-label randomized controlled trial
 concluded that the use of e-cigarettes as a tool for complete smoking cessation alongside standard smoking
 cessation treatment was more effective than standard treatment alone. At six months, biochemically validated
 continuous abstinence from smoking was 28.9% in the intervention group and 16.3% in the control group
 (RR = 1.77; 95% CI = 1.43-2.20) with similar serious adverse event profiles in both groups.

Analysis

- Positive Findings: E-cigarette usage decreased total nicotine usage.
- Study Concerns: Experimental and control groups were not suitably matched (e.g., the experimental group
 was given free e-cigarettes with optional, not-free nicotine replacement therapy while the control group was
 given \$50 that could be used towards nicotine replacement therapy). Additionally, nicotine abstinence rates
 (i.e., no use of tobacco cigarettes, e-cigarettes with nicotine, and nicotine-replacement therapy) were higher
 in the control group.
- Other Concerns: Long-term data on safety of e-cigarettes remains unknown.

Bottom Line

A large Swiss study found that e-cigarettes increased smoking cessation, but due to the study's potential methodological bias and the overall lack of long-term safety data on e-cigarettes, we are unlikely to recommend the use of e-cigarettes as a tool for patients looking to quit smoking.
